# Staff Update

---

# Pop quiz, hot shot

## 2017: Return of the Jedi, 3 forces align again

- ➔ **Ecosystem:** Recruit and collaborate with key players in containers & NFV ecosystems; continue to harness massive China growth; focus on new delivery models (not just on-prem DIY)
- ➔ **Software:** One Platform for bare metal, VMs, and containers will take work across teams; focus on innovation; PTG focused on breaking silos across projects
- ➔ **Users:** New User Committee comes to fruition; new Forum for tighter feedback loop; user survey + one-on-one dialog; upstream coaching for contributing organizations

# Perception Challenges

## Challenges

- ➔ “Public cloud is the only true cloud”... “and that’s AWS”
- ➔ “No one wants to manage their own infrastructure anymore”
- ➔ “Containers will replace OpenStack”
- ➔ “Contribution to OpenStack is declining”

## Proactive response

- ➔ Private cloud is what’s next. Companies moving workloads **from AWS to Private OpenStack**, realizing major cost savings
- ➔ Ecosystem stepping up to offer private cloud with the hands-off benefits of public cloud (Platform 9, Rackspace, Mirantis)
- ➔ Containers are complementary & rapidly being integrated (Kolla, Fuel CCP, Kuryr, Magnum); highlight innovation & position non-nova centric deployments as a win
- ➔ Investment and contribution growing globally, focus more on ecosystem wins

# Messaging Strategy

- **Costs less, does more.** Aggressively position cost savings & business value against AWS-only tactic in a multi-cloud world
- **All apps need Open Infrastructure.** Position OpenStack as the home of open infrastructure and innovation in amongst the emerging technology landscape

---

## Tactics: Going on the offense

- ➔ Pre-Ocata press tour: evolution of private cloud, new delivery models & innovation
- ➔ Revamp Project Navigator to expose more innovation and let OpenStack projects stand on their own (ie. it's a win if someone users Kubernetes + Keystone + Cinder)
- ➔ Large-scale campaign to change the perception of private cloud & OpenStack: cost savings, one platform, containers & SaaS enabling new consumption models
- ➔ Expand content focus for Summit & Superuser to broader “open infrastructure” theme to create a larger funnel...ex. Open Source Days in Boston
- ➔ Shift industry event strategy to relationship building & positioning amongst emerging technology landscape (KubeCon, DockerCon, even AWS re:invent)
- ➔ Shift appdev strategy from one to many to one to few key platforms that must work well on OpenStack

### Amazon (AMZN) Q4 Earnings In-Depth: AWS Growth Slows

by Ryan McQueeney Published on February 02, 2017

AMZN

+ Follow

E-commerce giant Amazon (AMZN - Free Report) just released its fourth-quarter fiscal 2016 earnings results. While Amazon made its name as an online shopping marketplace, one of the most notable aspects of today's report was the latest data from Amazon Web Services.

THE WEB INDUSTRY IPO SNAPCHAT

## Snapchat loses way more money than it makes

The company "may never achieve or maintain profitability."

By Tim Schiesser on Feb 2, 2017, 6:15 PM | 13 comments

4 Feb 2017 at 00:42, Iain Thomson

Snap Inc., the parent company behind Snapchat, filed today the relevant documents for their initial public offering (IPO). These S-1 documents give us a first glimpse into the company's operations, revealing

# Trend: Gen 2 Private Cloud

---

# What was Gen 1 private cloud?

## GEN 1 PRIVATE CLOUD

- Virtualization ++ (virtualization with some elasticity & self-service)
- Key technologies were VMware, Eucalyptus, CloudStack, OpenStack
- Immature technology, required significant technical resources
- Delivered cost savings at high scale; primarily used by technology companies (PayPal)
- Nascent commercial ecosystem
- Primarily on-prem deployments; no Day 1 value
- Challenges: technology, talent

# How does Gen 2 private cloud compare?

## GEN 1 PRIVATE CLOUD

- Virtualization ++ (virtualization with some elasticity & self-service)
- Key technologies were VMware, Eucalyptus, CloudStack, OpenStack
- Immature technology, required significant technical resources
- Delivered cost savings at high scale; primarily used by technology companies (PayPal)
- Nascent commercial ecosystem
- Primarily on-prem deployments; no Day 1 value
- Challenges: technology, talent

## GEN 2 PRIVATE CLOUD

- Virtualized **networks, storage, containers & bare metal**
- Key technologies are OpenStack, Cloud Foundry, Kubernetes, Mesos
- Better technology made **easier to deploy and manage** (using container orchestration in many cases) means smaller teams, greater ROI
- Achieve **cost savings** at smaller scale
- Mature **ecosystem** with new delivery models bring **Day 1 value** and **smaller teams**
- Challenges: culture, processes

# The multi-cloud advantage

Smart companies are getting **sophisticated about workload placement** across public and private clouds, based on cost, technology and regulatory requirements

# What's driving Gen 2 private cloud trend?

## COSTS LESS

**Desire to cut costs & improve management** of legacy applications, but still have strict regulatory and compliance concerns

**High public cloud bills** are starting to catch the eye of CFOs; no relief in sight since more workloads moving to the cloud

## DOES MORE

**Versatile & reliable** for more workloads and technologies, especially NFV, and those needing high-performance or “reachback” into corporate networks

**New delivery models**—including remotely managed private cloud—means faster time to value and less dependency on technical staff

# Business Driver: Cost Savings

## Snapdeal reports increase in efficiencies from home grown hybrid cloud

Snapdeal, an online marketplace, reported that the deployment of its in-house hybrid cloud solution Snapdeal Cirrus, has led to a massive impact on cost and business optimisation – the headline being a 75 percent drop in its monthly infrastructure costs.

## Pubmatic swaps AWS for OpenStack after public cloud hidden-cost horror show

When this decision maker decided to pick Amazon Web Services because his devs needed cloud in a hurry, he didn't know what he was letting himself in for. A move to OpenStack and all was well eventually, but only after the painful lessons hundreds of thousands of dollars can teach you.

Tamlin Magee  
April 28, 2016

“In all private cloud-based applications (productive, development etc.), **we expect approximately 70% of cost savings** as compared to classical IT solutions”

– **Holger Urban, Volkswagen**

---

## Business Driver: Cost Savings

Enterprises achieving labor efficiencies of **at least 400 virtual machines (VMs) per engineer** are poised to have lower TCO for a self-managed cloud than public or managed cloud options.

- Owen Rogers, 451 Research, October 2016

**Public cloud based pricing models are generally optimized for development workloads that have a lifespan of months, not years...**as IT organizations crunch the numbers for their bandwidth-intensive production workloads, private cloud often comes out on top.

- Gina Longoria, Moor Insights & Strategy, Oct 2016

### AT&T raises SDN network transformation goal to 55% for 2017

by Sean Buckley | Feb 2, 2017 12:35pm

“A few years ago Openstack made all the difference for us and enabled the company to succeed with its transition to microservices. Now Openstack, together with Kubernetes and Docker will enable us to take the next step in speed of delivery, uptime and a hybrid cloud approach.”  
*Koby Holzer, Cloud Engineering Director, LivePerson*

# How do you get OpenStack?

1

## Public cloud providers

2

## Managed private cloud

**A** Remotely managed in your datacenter

OR

**B** Hosted private cloud in service provider facility

3

## Distros—manage packaging and testing

# How did it go?

## OpenStack sets its sights on the next generation of private clouds

Posted Feb 22, 2017 by [Frederic Lardinois \(@fredericl\)](#)

## BOUNCING BACK TO PRIVATE CLOUDS WITH OPENSTACK

March 1, 2017 Timothy Prickett Morgan

There is an adage, not quite yet old, suggesting that compute is free but storage is not. Perhaps a more accurate and, as far as public clouds are concerned, apt adaptation of this saying might be that computing and storage are free, and so are inbound networking within a region, but moving data across regions in a public cloud is brutally expensive, and it is even more costly spanning regions.

“When OpenStack was just starting, it was basic virtualization with self service and elastic provisioning. When you look at it now, what you see are cloud native applications, but also things like SAP and network function virtualization workloads. So the private cloud today **costs less**, but it also **does more.**”

—Me

## Public Vs. Private Cloud: Beyond Basic Economics

- Blog

March 07, 2017

Grant Kirkwood

By Grant Kirkwood

The sides are lining up in the cloud war over which solution is best: A public shared **cloud**, in which resources can be increased or decreased in real time, or a private cloud, with resources built by or available exclusively to one organization on dedicated hardware, on premises or collocated.

There is a compromise, namely hybrid cloud, ideally with seamless burst and workload portability. But even then, a decision must be made on public vs. private balance. And that comes down to more than economics.

OpenStack Says Private Clouds Save Big \$\$\$ Versus Public Clouds

Ocata-bove the rest—OpenStack pushes containers in latest cloud release

...proves containers are not the death of OpenStack

OpenStack Ocata: Container All the Way Down

Improvement of core infrastructure services and container integration...

...focus on containers and stability at scale

OpenStack Ocata Nova cells set to improve cloud stability

...Improves cloud useability and federation

Ocata...enhances container integration

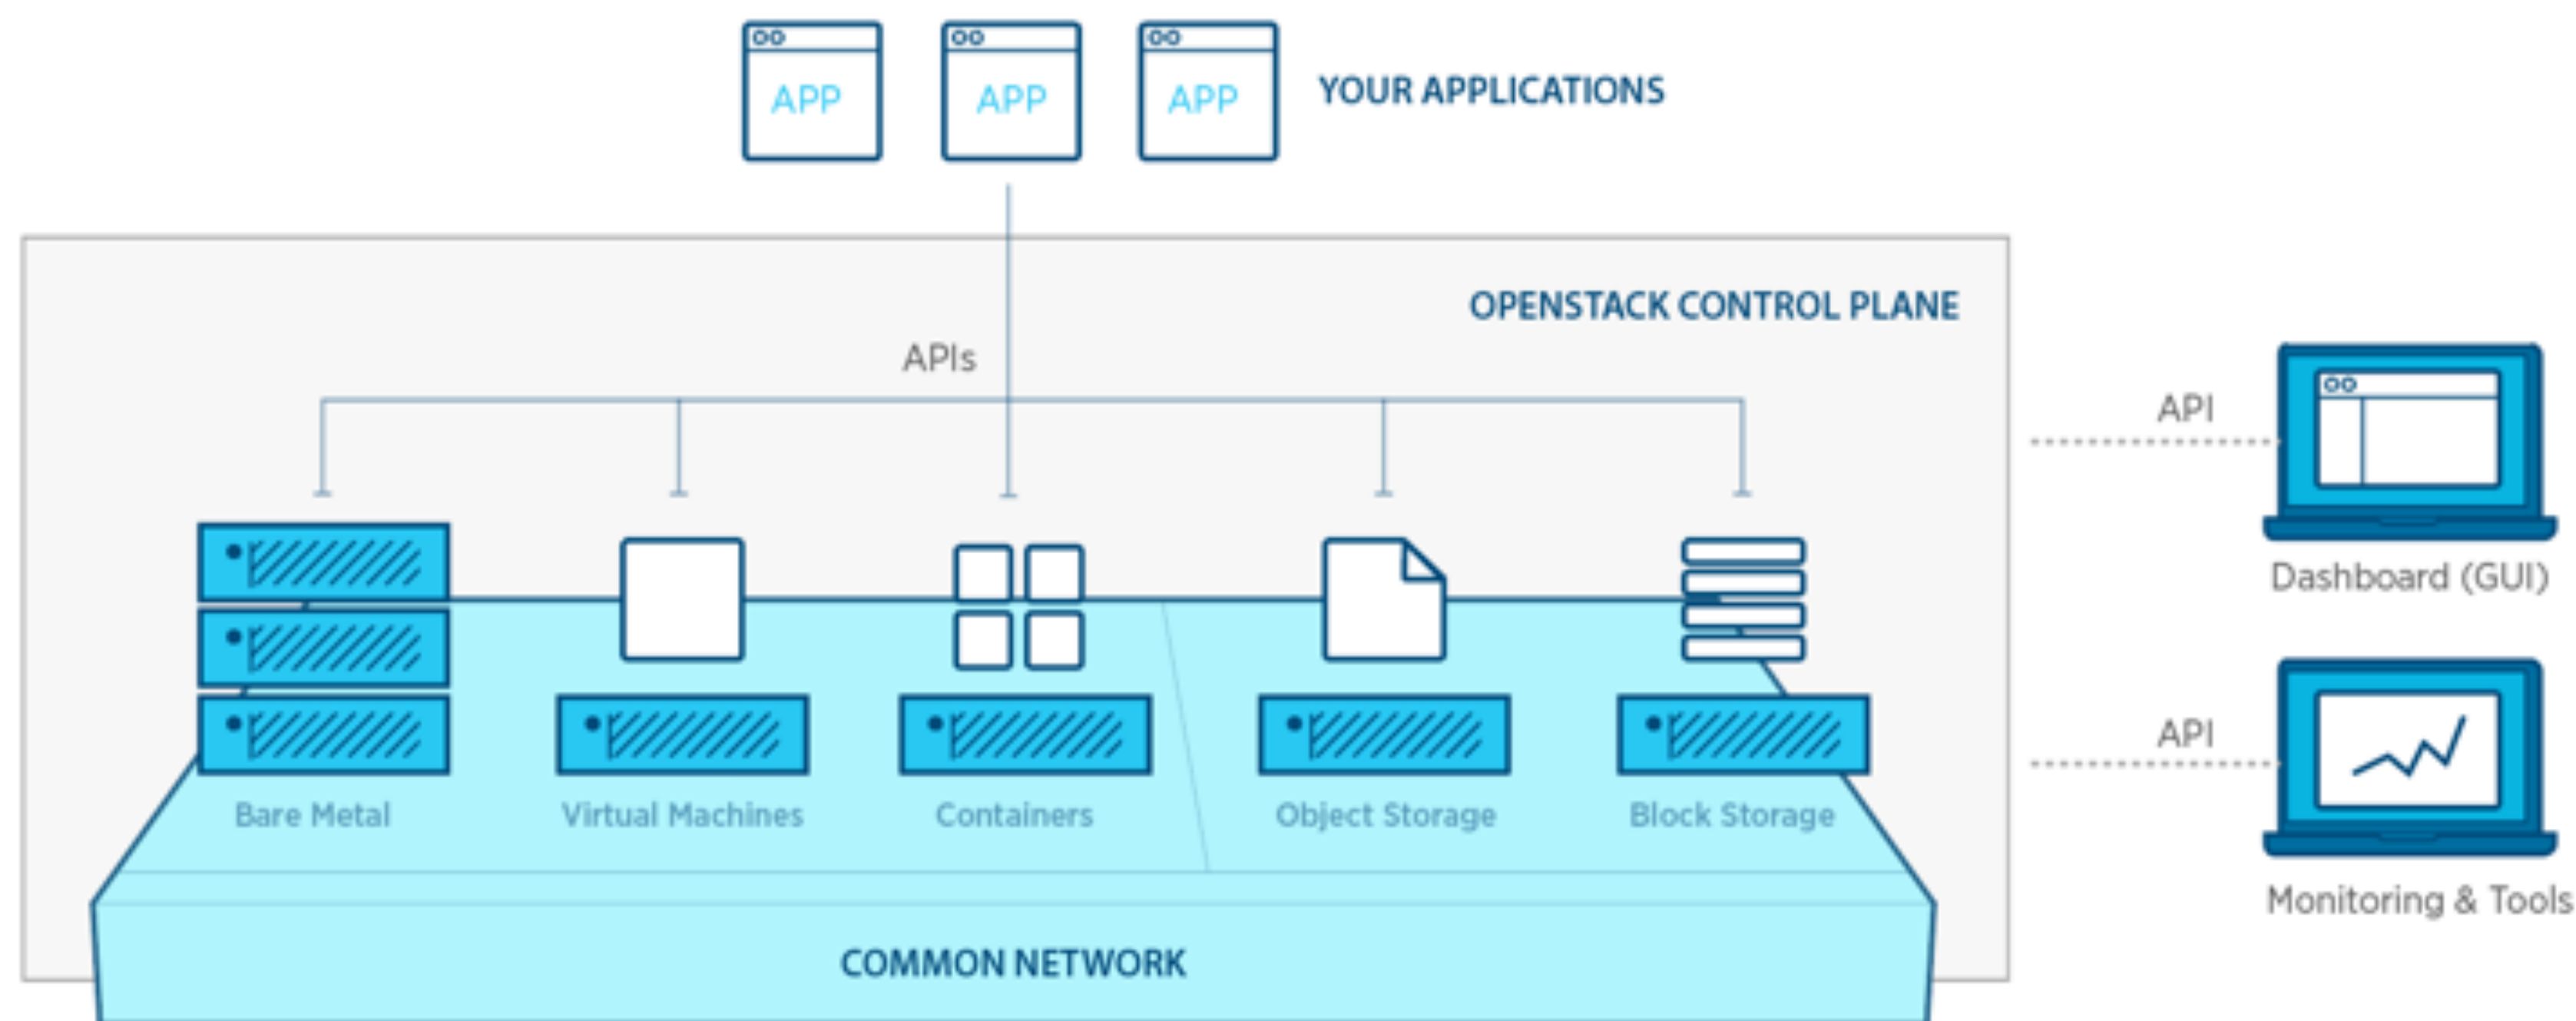

OpenStack sets its sights on the next generation of private clouds

# OpenStack Ocata

The 15th release of OpenStack

# One platform: bare metal, VMs, containers

OpenStack provides **one platform to orchestrate bare metal, containers and virtual machines on a single network** allowing private users to optimize for their application without creating more silos in their datacenter, and giving service providers more capabilities.

---

## OpenStack Ocata - February 22nd

- Four-month development cycle compared to typical six-month cycle
- Primarily a stabilization / maturity release
- New capabilities and enhancements emphasize **three themes** (in order of prominence):
  - User Experience
  - Scalability
  - Manageability

# Manageability and Scalability

- **Nova** scheduling and cells v2 for workload optimization and improved scaling
- **Ironic** networking and driver enhancements
- **Zaqar** messaging service added **Swift** as backend to easily leverage existing Swift cluster without deploying another MongoDB or Redis cluster
- Greatly improved performance and CPU usage for **Telemetry** projects: storing millions of metrics per second is now possible using **Ceilometer** with **Gnocchi** storage engine
- New **os-profiler tool** gives operators ability to detect performance issues across OpenStack services
- Active/Active HA in **Cinder** service can now be implemented by drivers
- **Kolla** support for Kubernetes on the control plane

---

## User Experience

- New community images in **Glance** give end users an easy way to share images with all other users in a cloud. The visibility changes make it much more clear who has access to an image.
- **Horizon** support for keystone-to-keystone federation as well as improvements to security and access UIs and new os-profiler UI.
- Auto-provisioning for **Keystone** federated identity dynamically creates a project and assigns a federated user a role upon successful authentication
- **Sahara** big data service updated plugins to better support latest versions of Hadoop and Cloudera
- **Congress** policy language enhancements to enable network address operations for better network and security governance

---

## Cross-project support for containers

- Lots of action inside and on the periphery of OpenStack for container-based deployment & management tools
- **Zun**, **Kolla**, and **Kuryr** saw the most contributor growth in Ocata cycle
- **Magnum** now supports DC/OS as a cluster type as well as Kubernetes on Suse
- **Kuryr** container networking service now supports Docker Swarm
- New “Fuxi” subproject of **Kuryr** connects **Cinder** and **Manila** storage to container environments

# Ocata contributor profile: ~2,000 individuals from 52 countries and 265 organizations

## TOP 10 COUNTRIES

- United States
- China
- Russia
- India
- Ukraine
- Great Britain
- France
- Japan
- Israel
- Germany

- Red Hat
- Mirantis
- IBM
- Intel
- HPE
- Rackspace
- Huawei
- ZTE
- NEC
- Cisco

# Atlanta PTG

---

## Successful first PTG

- Planned for 500. Had **508 register** and **478 attend**
- **Approx 40 project teams** participated on sit
- **27 countries**; 40% non-US attendees
- Over budget due to hotel room bookings, but making adjustments for September
- General consensus on areas for improvement around scheduling and visibility of topics of discussion in different rooms

- 
- “It was probably **one of the most productive weeks** I’ve had as a OpenStack developer. The Summits were too ‘noisy’, with all the distractions of keynotes, marketplace, presentations, and business /marketing people all over the place. The midcycles were much more focused on developer issues, but since they were usually single-team events, that meant very little cross-project interaction. The PTG represented the best of both without their downsides.”
  - “In my experience, this PTG did exactly what it was designed to do. Based on what I observed at this first event, **the PTG was magical**. The way that everyone comes together for a week and makes it a priority to only work on OpenStack projects is the real magic at the PTG (and you didn’t even have to bring trading cards.).... The PTG really brings us back to where this whole thing started, reminds us of what OpenStack really is, **it’s the people, not the technology**. It’s people with ideas who aren’t afraid to share, others who believe in those ideas, and the community of people who are willing to put everything aside, if just for a little while, to make this amazing project happen.”

## Next up...

- Operator Meetup in Milan
- OpenStack Summit and Forum in Boston, May 8-11
  - Will be the Forum for the Queens release cycle
  - Attendance is tracking toward our goal, but sponsorships are short still (busy week for tech events)
- Planning next PTG (Queens release cycle) for September
